# **ENERGY POLICY**

Environment

In accordance with Management's wishes and commitment, Indra has established and implemented an energy management system based on the requirements of standard ISO 50001.

Indra, a leader in Information Technologies, is organized into two major segments, Solutions and Services, in which over the years it has developed a deep understanding of the business and established a strong relationship with its customers. The knowledge it has gained and its state-of-the-art technology have allowed Indra to create a differentiated offering, fostering the development of its own solutions and services for each segment of the market.

The energy management system defined by Indra is applicable to the activities undertaken at its certified work centers.

Our energy policy defines the commitment to undertake our activities within the parameters of sustainable development, controlling and managing energy use.

Accordingly, Indra is committed to undertaking its activities in such a way as to improve energy performance at its facilities where an energy management system has been implemented.

To fulfill this commitment and achieve the defined objectives, Management has established the following fundamental principles:

- Minimize negative impacts and control the use of energy, making a continuous effort to identify, characterize and minimize the energy impact of our activities and facilities and ensuring the efficient use of energy resources with the aim of improving our energy performance.
- Ensure compliance with energy legislation and other applicable requirements related to the company's energy uses, consumptions and efficiency.
- Identify and assess energy uses in order to foster prevention and the efficient use of energy rather than correction and poor use.
- Establish and periodically review energy management objectives and targets that contribute to continuous improvement and the promotion of energy saving.
- Promote the acquisition of energy-efficient products and services and design to improve energy performance.
- Favor internal and external communication and information related to energy efficiency, placing the company's energy policy at the disposal of the stakeholders and guaranteeing that this policy is communicated to, understood and assumed by the entire organization.
- Provide the information and human and material resources necessary for the implementation of this policy, including those necessary for the implementation of activities arising from the implemented energy management system.
- Foster training in energy management in the organization and guarantee the training of all those directly involved in the management system.
